

## FULL PREMIUM GUIDE: PHP FILE UPLOAD SYSTEM — STEP BY STEP

This guide explains the complete file upload system suitable for any website.

### 1. REQUIRED FOLDER STRUCTURE

project-folder/

■ upload.php

■ upload-process.php

■ uploads/ (folder with write permission)

■ config.php

### 2. DATABASE TABLE

Use this SQL:

```
CREATE TABLE uploads (  
id INT AUTO_INCREMENT PRIMARY KEY,  
file_name VARCHAR(255),  
uploaded_on TIMESTAMP DEFAULT CURRENT_TIMESTAMP  
);
```

### 3. upload.php — FORM

A simple upload form: Choose file → Submit → Sent to upload-process.php

### 4. upload-process.php — LOGIC STEPS

1. Check if file is uploaded.
2. Validate extension (jpg, png, pdf, docx, etc.).
3. Rename file to avoid duplicates.
4. Move file to uploads/ folder.
5. Insert file name into database.
6. Show success message.

## 5. config.php — DATABASE CONNECTION

```
$db = mysqli_connect('localhost', 'root', '', 'testdb');
```

## 6. DISPLAYING UPLOADED FILES

Fetch data:

```
SELECT * FROM uploads ORDER BY id DESC;
```

Show file paths:

```
uploads/filename.jpg
```

## 7. SECURITY RULES

- Validate file extensions
- Limit max size
- Rename files
- Block executable uploads
- Never trust user input

## 8. WHAT YOU CAN BUILD WITH THIS

- Property image uploader
- Resume uploader
- Document manager
- Admin panel uploads
- User profile images
- Many more...

For more features you can request:

multi-upload, drag-drop, progress bar, thumbnails, admin dashboard.
